

- (b) a membrane in overlying relationship to said first support;
- (c) a plurality of first elongate conductors supported by said membrane;
- (d) a plurality of contacts supported by said membrane, each of said contacts electrically connected to at least a respective one of said first conductors;
- (e) a second support suitable to support said first support thereon for probing said electrical device;
- (f) a second elongate conductor having a first end supported by said second support;
- (g) a third elongate conductor spaced apart from said second elongate conductor;
- (h) a fourth elongate conductor spaced apart from said second elongate conductor, wherein said second conductor is located between said third conductor and said fourth conductor; and
- (i) an interconnecting conductor electrically interconnecting said third conductor and said fourth conductor at a location beyond said first end of said second elongate conductor.

- 3. The probing device of claim 2 wherein said interconnecting conductor is substantially coplanar with said third conductor and said fourth conductor.
- 4. The probing device of claim 2 wherein said interconnecting conductor is substantially coplanar with said second conductor.

5. The probing device of claim 2 wherein said second conductor provides a test signal.
6. The probing device of claim 5 wherein said third conductor provides a guard signal.
7. The probing device of claim 1 wherein said fourth elongate conductor has a first surface area in a region proximate to said first end of said second elongate conductor greater than a second surface area of said third elongate conductor in a region proximate to said first end of said second elongate conductor.
8. A probing device for probing an electrical device comprising:
 - (a) a first support;
 - (b) a membrane in overlying relationship to said first support;
 - (c) a plurality of first elongate conductors supported by said membrane;
 - (d) a plurality of contacts supported by said membrane, each of said contacts electrically connected to at least a respective one of said first conductors;
 - (e) a second support suitable to support said first support thereon for probing said electrical device;
 - (f) a second elongate conductor having a first end supported by said second support;

- (g) a third elongate conductor spaced apart from said second elongate conductor, wherein said second conductor is located between said third conductor and said fourth conductor;
 - (h) a fourth elongate conductor spaced apart from said second elongate conductor, said fourth elongate conductor having a first surface area in a region proximate to said first end of said second elongate conductor greater than a second surface area of said third elongate conductor in a region proximate to said first end of said second elongate conductor.
9. The probing device of claim 8 wherein said first surface area has a maximum width greater than a maximum width of said second surface area.
10. The probing device of claim 8 further comprising an interconnecting conductor electrically interconnecting said third conductor and said fourth conductor at a location beyond said first end of said second elongate conductor.
11. The probing device of claim 10 wherein said interconnecting conductor is substantially coplanar with said third conductor and said fourth conductor.
12. The probing device of claim 11 wherein said interconnecting conductor is substantially coplanar with said second conductor.

13. The probing device of claim 8 wherein said second conductor provides a test signal.
14. The probing device of claim 8 wherein said third conductor provides a guard signal.
15. A probing device for probing an electrical device comprising:
- (a) a first support;
 - (b) a membrane in overlying relationship to said first support;
 - (c) a plurality of first elongate conductors supported by said membrane;
 - (d) a plurality of contacts supported by said membrane, each of said contacts electrically connected to at least a respective one of said first conductors;
 - (e) a first one of said first elongate conductors having a first end;
 - (f) a second one of said first elongate conductors spaced apart from said first one;
 - (g) a third one of said first elongate conductors spaced apart from said first one, wherein said first one is located between said second one and said third one; and
 - (h) a first interconnecting conductor electrically interconnecting said second one and said third one at a location beyond said first end of said first one.
16. The probing device of claim 15 further comprising:

- (a) a second support suitable to support said first support thereon for probing said electrical device;
- (b) a second elongate conductor having a first end supported by said second support;
- (c) a third elongate conductor spaced apart from said second elongate conductor;
- (d) a fourth elongate conductor spaced apart from said second elongate conductor, wherein said second conductor is located between said third conductor and said fourth conductor; and
- (e) a second interconnecting conductor electrically interconnecting said third conductor and said fourth conductor at a location beyond said first end of said second elongate conductor.

- 17. The probing device of claim 16 wherein said second interconnecting conductor is substantially coplanar with said third conductor and said fourth conductor.
- 18. The probing device of claim 16 wherein said second interconnecting conductor is substantially coplanar with said second conductor.
- 19. The probing device of claim 16 wherein said second conductor provides a test signal.

20. The probing device of claim 19 wherein said third conductor provides a guard signal.
21. The probing device of claim 16 wherein said fourth elongate conductor has a first surface area in a region proximate to said first end of said second elongate conductor greater than a second surface area of said third elongate conductor in a region proximate to said first end of said second elongate conductor.
22. The probing device of claim 15 wherein said first interconnecting conductor is substantially coplanar with said second one and said third one.
23. The probing device of claim 15 wherein said second interconnecting conductor is substantially coplanar with said first one.
24. The probing device of claim 15 wherein said first one provides a test signal.
25. The probing device of claim 24 wherein said second one provides a guard signal.
26. A probing device for probing an electrical device comprising:
 - (a) a first support;
 - (b) a membrane in overlying relationship to said first support;
 - (c) a plurality of first elongate conductors supported by said membrane;

- (d) a plurality of contacts supported by said membrane, each of said contacts electrically connected to at least a respective one of said first conductors;
- (e) a second support suitable to support said first support thereon for probing said electrical device;
- (f) a second elongate conductor having a first end supported by said second support;
- (g) a fifth elongate conductor having a first end supported by said second support;
- (h) a third elongate conductor spaced apart from said second elongate conductor;
- (i) a fourth elongate conductor spaced apart from said second elongate conductor, wherein said second conductor and said fifth conductor are located between said third conductor and fourth conductor; and
- (j) a first interconnecting conductor electrically interconnecting said third conductor and said fourth conductor at a location beyond said first end of said second elongate conductor and said first end of said fifth conductor.

27. The probing device of claim 26 for probing an electrical device comprising:

- (a) a first one of said first elongate conductors having a first end;
- (b) a second one of said first elongate conductors having a first end;
- (c) a fourth one of said first elongate conductors spaced apart from said first one;

- (d) a third one of said first elongate conductors spaced apart from said first one, wherein said first third and said fourth one are located between said second one and said first one; and
 - (e) a second interconnecting conductor electrically interconnecting said third one and said fourth one at a location beyond said first end of said first one and said first end of said second one.
28. The probing device of claim 26 wherein said second conductor and said fifth conductor are substantially coplanar with said third conductor and said fourth conductor.
29. The probing device of claim 26 wherein said first interconnecting conductor is substantially coplanar with said second conductor.
30. The probing device of claim 26 wherein said second conductor provides a force signal.
31. The probing device of claim 30 wherein said fifth conductor provides a sense signal.
32. The probing device of claim 30 wherein said third conductor provides a guard signal.
